OBJECTIVE

The relations between longevity and the recently implemented body condition score (BCS) and locomotion (LOC) evaluations were examined using the Weibull proportional hazard model.

CONCLUSIONS

Intermediate BCS scores – favorable in relation to longevity
Low locomotion scores – negative effect on longevity

MATERIAL AND METHODS

Locomotion (LOC)

characterizing the use of legs and feet, length and direction of the step scored from 1 to 9:
1-3 severe abduction (deviation from a straight line) and short stride
4-6 slight abduction and medium stride
7-9 no abduction and long stride

Body condition score (BCS)

characterizing the covering of fat over the tail head and rump scored from 1 to 9:
1-3 poor
4-6 intermediate
7-9 grossly fat

Longevity

True longevity (TL) – number of days from first calving to culling (uncensored records) or last test day (censored records)

Functional longevity (FL) – TL corrected for within-herd-year-season phenotypic production of a cow

Weibull proportional hazard model

\[ h(t) = h_0(t) \times \exp(hys(t) + age + ys(t) + ls(t) + hsize(t) + BCS/LOC) \]

\[ TL \]

\[ FL \]

Estimation. Survival Kit v6.06 was used (Ducrocq V., Sölkner J., Mészáros G., 2010)

Data from the SYMLEK Polish National Recording System provided by the Polish Federation of Cattle Breeders and Dairy Farmers

RESULTS

Likelihood ratio tests (Fig. 1)

- highly significant effects of BCS and LOC on risk of culling
- stronger effect on TL than on FL for both BCS and LOC
- impact of BCS greater than that of LOC

Relative Risk of Culling (RRC)

BCS

- intermediate optimum (score 5) for true and functional longevity (Fig. 2)
- Cows with low BCS were 3 times (for TL) and 1.6 times (for FL) more likely to be culled than cows with average score 5
- Cows with high BCS were 1.7 (for TL) and 1.3 (for FL) times more likely to be culled than cows with average score

Locomotion

- low scores associated with the highest risk of culling (Fig. 3)
- TL: RRC decreased more than twice with locomotion score increasing from 1 to 5; further score increases almost did not change RRC
- FL: RRC was lowest for intermediate LOC score 6; cows with low score had up to a 40% worse chance to survive as compared to cows with the optimal score, and a 20% worse chance as compared to cows with the highest score
